Phase 1: Setup (hours 0-3)

- **All:** *"A desk gadget that turns focus sessions into XP so students stay on task."*
- **All:** Create a shared GitHub repo, with one folder each for `firmware/`, `dashboard/`, and `docs/`
    - `Firmware: code that runs on the Arduino.`
    - `Dashboard:`
- **H:** Set the shield's slide switch to **5V**
- **F:** Install the Arduino IDE and confirm you can upload a blink sketch
- **S:** Install Python and `pyserial`, and set up a virtual environment
- **All:** Write down the pin map D6- LED

Definitions:

Repo: A shared folder everyone can edit

Serial: The built-in system used for serial communication, which allows your Arduino board to send and receive data byte-by-byte to and from a computer or other hardware devices

State machine: SYour device is always in exactly one state, and it only changes state when a specific event happens. Instead of one tangled loop full of if statements, you ask "what state am I in, and what should happen here?"

Grove light sensor v1.2 1/20/16: Values 40 and above = productive
https://sensorkit.arduino.cc/sensorkit/module/lessons/lesson/05-the-light-sensor

LED socket kit v1.5: Should blink a couple times to indicate that session is over as a substitute for the buzzer
